Frontend Setup

Make sure you are in the root directory and open a new terminal.

Commands:

cd ./frontend

npm install

After installation, open the main.tsx file and replace the Google Client ID with your own.

Ensure the .env file is properly configured.

Auth Service Setup

cd ./services/auth

npm install

Configure the .env file with required values.

Restaurant Service Setup

Set up RabbitMQ locally using Docker (refer to the video timestamps).

cd ./services/restaurant

npm install

Configure the .env file.

Utils Service Setup

cd ./services/utils

npm install

Add payment service keys and Cloudinary credentials in .env.

Realtime Service Setup

cd ./services/realtime

npm install

Configure the .env file.

Rider Service Setup

cd ./services/rider

npm install

Configure the .env file.

Admin Service Setup

cd ./services/admin

npm install

Use the same database name as other services.

Running Services

Run each service in a separate terminal using:

npm run dev
